

Harrison Williams

PhD candidate, Dept. of Computer Science
Virginia Tech

<https://harriswms.github.io/>
hrwill@vt.edu

Research Interests	I am broadly interested in computer architecture, embedded/IoT system design, and networking. My PhD research focuses on novel chip- and board-level hardware designs alongside software techniques to bring new capabilities to and improve the efficiency of batteryless energy harvesting systems.		
Education	PhD, Computer Science <i>Virginia Tech</i>	2019-2024	Advisor: Dr. Matthew Hicks
	Dual BS, Electrical & Computer Engineering <i>Virginia Tech</i>	2015-2019	
Conference Publications	<p>[5] A Difference World: High-performance, NVM-invariant, Software-only Intermittent Computation. Harrison Williams*, Saim Ahmad*, and Matthew Hicks. *Equal contribution. <i>USENIX Annual Technical Conference (ATC)</i>, 2024.</p> <p>[4] Energy-Adaptive Buffering for Efficient, Responsive, and Persistent Batteryless Systems. Harrison Williams and Matthew Hicks. <i>Architectural Support for Programming Languages and Operating Systems (ASPLOS)</i>, 2024.</p> <p>[3] Practical Considerations of Energy Harvesting Source in Minimization of Age of Information with Updating Erasures. Fariborz Lohrabi Pour, Harrison Williams, Matthew Hicks, and Dong Sam Ha. <i>International Symposium on Circuits & Systems (ISCAS)</i>, 2023.</p> <p>[2] Failure Sentinels: Ubiquitous Just-in-time Intermittent Computation via Low-cost Hardware Support for Voltage Monitoring. Harrison Williams, Michael Moukarzel, and Matthew Hicks. <i>International Symposium on Computer Architecture (ISCA)</i>, 2021.</p> <p>[1] Forget Failure: Exploiting SRAM Data Remanence for Low-overhead Intermittent Computation. Harrison Williams, Xun Jian, and Matthew Hicks. <i>Architectural Support for Programming Languages and Operating Systems (ASPLOS)</i>, 2020.</p>		
Preprints	<ul style="list-style-type: none">• A Software Caching Runtime for Embedded NVRAM Systems. Harrison Williams and Matthew Hicks. <i>Under Review</i>.• Residual Sentinels: Scavenging Post-computation Utility in Energy Harvesting Systems with Just-right Power-down Voltage Monitoring. Harrison Williams and Matthew Hicks. <i>Under review</i>.		
Funding	<p>[1] NSF SHF: Small: Circuit Support for Maintaining the Continuous-power Abstraction in Energy Harvesting Systems</p> <ul style="list-style-type: none">• Principal Investigator: Dr. Matthew Hicks.• Timeframe: 2023-09-01 to 2026-08-31.• Total: \$450,000.• Role: Co-author. My work on hardware support for batteryless systems was the basis of this grant. I provided preliminary data and wrote the grant with Dr. Hicks.		
Professional Experience	Virginia Tech Graduate Research Assistant Graduate Teaching Assistant Undergraduate Research Assistant	2019-Present CS 4264: Principles of Computer Security 2017-2019	
	Raytheon Missile Systems Technical Intern	Summers 2017, 2018	
Selected Projects	<p><i>Graduate Research</i></p> <ul style="list-style-type: none">• Software Caching Runtimes: Emerging memories enable low-power microcontrollers to record and operate on large data streams, but do so with a performance penalty due to energy and latency limitations. This work explores software techniques to offload code and data to higher-performance on-chip SRAM to improve performance and energy efficiency. Outcome: One paper under submission.		

- **Dynamic Energy Buffering:** Batteryless systems store energy in capacitors and face performance tradeoffs based on capacitor size. This work introduces adaptive and efficient variable-capacitance circuits to blend the advantages of different capacitor sizes. **Outcome:** One conference paper (ASPLOS '24).
- **Integrated Circuits for Batteryless Systems:** Designed custom integrated circuits for variable-resolution supply voltage supervisors targeting energy-constrained batteryless systems. **Outcome:** One conference paper (ISCA '21) and one paper under submission.
- **SRAM-based Intermittent Computation:** Batteryless devices operate intermittently on harvested energy, but need high-performance non-volatile memory to preserve program state. This work uses SRAM data remanence to preserve program state and eliminate the need for high-performance memory. **Outcome:** One conference paper (ASPLOS '20) and one paper under submission.

Undergraduate Research

- **Counterfeit Device Detection:** SRAM cells age as they hold data, revealing information about software operation through transistor-level changes visible in memory startup state. This work uses these software-induced changes to detect counterfeit recycled microcontrollers using statistical analysis to compare aged devices with an unaged golden model. **Outcome:** <https://arxiv.org/pdf/2009.04002.pdf>.

Recognition

Davenport Leadership Scholarship 2022
NSF Graduate Research Fellowship Program 2021
Honorable Mention
