

# Harrison Williams

PhD candidate, Dept. of Computer Science  
Virginia Tech

<https://harriswms.github.io/>  
hrwill@vt.edu

Research Interests	I am broadly interested in computer architecture, embedded/IoT system design, and networking. My PhD research focuses on novel chip- and board-level hardware designs alongside software techniques to bring new capabilities to and improve the efficiency of batteryless energy harvesting systems.		
Education	PhD, Computer Science		2019-2024
	Circuit Support for Practical and Performant Batteryless Systems Virginia Tech	Advisor: Dr. Matthew Hicks	
	Dual BS, Electrical & Computer Engineering		2015-2019
	Virginia Tech		
Conference Publications	[6]	A Software Caching Runtime for Embedded NVRAM Systems. <a href="#">Harrison Williams</a> and Matthew Hicks. <i>Architectural Support for Programming Languages and Operating Systems (ASPLOS)</i> , 2025.	
	[5]	A Difference World: High-performance, NVM-invariant, Software-only Intermittent Computation. <a href="#">Harrison Williams*</a> , Saim Ahmad*, and Matthew Hicks. *Equal contribution. <i>USENIX Annual Technical Conference (ATC)</i> , 2024.	
	[4]	Energy-Adaptive Buffering for Efficient, Responsive, and Persistent Batteryless Systems. <a href="#">Harrison Williams</a> and Matthew Hicks. <i>Architectural Support for Programming Languages and Operating Systems (ASPLOS)</i> , 2024.	
	[3]	Practical Considerations of Energy Harvesting Source in Minimization of Age of Information with Updating Erasures. Fariborz Lohrabi Pour, <a href="#">Harrison Williams</a> , Matthew Hicks, and Dong Sam Ha. <i>International Symposium on Circuits &amp; Systems (ISCAS)</i> , 2023.	
	[2]	Failure Sentinels: Ubiquitous Just-in-time Intermittent Computation via Low-cost Hardware Support for Voltage Monitoring. <a href="#">Harrison Williams</a> , Michael Moukartzel, and Matthew Hicks. <i>International Symposium on Computer Architecture (ISCA)</i> , 2021.	
	[1]	Forget Failure: Exploiting SRAM Data Remanence for Low-overhead Intermittent Computation. <a href="#">Harrison Williams</a> , Xun Jian, and Matthew Hicks. <i>Architectural Support for Programming Languages and Operating Systems (ASPLOS)</i> , 2020.	
Funding	[1]	NSF SHF: Small: Circuit Support for Maintaining the Continuous-power Abstraction in Energy Harvesting Systems	
		<ul style="list-style-type: none"><li>Principal Investigator: Dr. Matthew Hicks.</li><li>Timeframe: 2023-09-01 to 2026-08-31.</li><li>Total: \$450,000.</li><li>Role: Co-author. My work on hardware support for batteryless systems was the basis of this grant. I provided preliminary data and wrote the grant with Dr. Hicks.</li></ul>	
Professional Experience	Virginia Tech		
	Graduate Research Assistant		2019-Present
	Graduate Teaching Assistant	CS 4264: Principles of Computer Security	Fall 2019
	Undergraduate Research Assistant		2017-2019
	Raytheon Missile Systems		
	Technical Intern		Summers 2017, 2018

Updated May 26, 2024.

## Selected Projects

### Graduate Research

- **Software Caching Runtimes:** Emerging memories enable low-power microcontrollers to record and operate on large data streams, but do so with a performance penalty due to energy and latency limitations. This work explores software techniques to offload code and data to higher-performance on-chip SRAM to improve performance and energy efficiency. **Outcome:** One conference paper (ASPLOS '25).
- **Dynamic Energy Buffering:** Batteryless systems store energy in capacitors and face performance tradeoffs based on capacitor size. This work introduces adaptive and efficient variable-capacitance circuits to blend the advantages of different capacitor sizes. **Outcome:** One conference paper (ASPLOS '24).
- **Integrated Circuits for Batteryless Systems:** Designed custom integrated circuits for variable-resolution supply voltage supervisors targeting energy-constrained batteryless systems. **Outcome:** One conference paper (ISCA '21) and one paper under submission.
- **SRAM-based Intermittent Computation:** Batteryless devices operate intermittently on harvested energy, but need high-performance non-volatile memory to preserve program state. This work uses SRAM data remanence to preserve program state and eliminate the need for high-performance memory. **Outcome:** Two conference papers (ASPLOS '20, ATC '24).

### Undergraduate Research

- **Counterfeit Device Detection:** SRAM cells age as they hold data, revealing information about software operation through transistor-level changes visible in memory startup state. This work uses these software-induced changes to detect counterfeit recycled microcontrollers using statistical analysis to compare aged devices with an unaged golden model. **Outcome:** <https://arxiv.org/pdf/2009.04002.pdf>.

## Recognition

**Davenport Leadership Scholarship**

2022

**NSF Graduate Research Fellowship Program**

2021

*Honorable Mention*

## Service

**Reviewer:**

Journal of Systems Architecture

JSA '24

**Sub-reviewer:**

Architectural Support for Programming Languages and Operating Systems

ASPLOS '24, '23, '20

European Conference on Computer Systems

EuroSys '22

Transactions on Embedded Computing Systems

TECS '21

Design Automation Conference

DAC '20

Languages, Compilers, Tools and Theory of Embedded Systems

LCTES '20

International Workshop on Energy Harvesting & Energy-Neutral Sensing Systems

ENSsys '19
